

Research Interests

My research interest spans programming languages, security, and systems (intersecting also with software engineering), focusing on developing novel theories, techniques, and tools for improving the performance, usability, reliability, and security of real-world computer software. In particular, I am currently working on static program analysis and compiler optimization problems, including **pointer analysis** and **data-flow analysis**, for large-scale real-world software applications (with millions of lines of code). I also have broad interests in type systems and formal verification.

Education

- April 2022 **Ph.D., Computer Science and Engineering**,
University of New South Wales (UNSW), Sydney, Australia.
Advisor: Scientia Professor Jingling Xue, IEEE Fellow
- July 2018 **M.Sc.Eng., Computer Science and Technology**,
Institute of Computing Technology, CAS (ICT, CAS), and
University of Chinese Academy of Sciences (UCAS), Beijing, China.
Advisor: Professor Lian Li
- July 2014 **B.Sc., Astronomy**,
Beijing Normal University (BNU), Beijing, China.
Advisor: Assoc. Prof. Heng Yu
- July 2013 **B.Sc., Educational Technology**,
Beijing Normal University (BNU), Beijing, China.
Advisors: Lecturer Qing Chen and Professor ShengQuan Yu

Research Experience

- March 2022 **Postdoctoral Research Fellow**,
– Present *University of New South Wales (UNSW)*, Sydney, Australia.
Advisor: Scientia Professor Jingling Xue, IEEE Fellow
- July 2018 – **Research Associate**,
Feb 2019 *Institute of Computing Technology, CAS (ICT, CAS)*, Beijing, China.
Advisor: Professor Lian Li

Supervisory Experience

- March 2022 **Yujiang Gui**, a *Ph.D. student working on Android information flow analysis*,
– present Co-supervised with Scientia Professor Jingling Xue.
- Sep 2017 – **Hengjie Zheng**, an *undergraduate thesis student from Wuhan University, working on Android API evolution*.
May 2018

(Selected) Honors and Awards

- 2019 **ACM SIGSOFT Distinguished Paper Award (ASE 2019)**
- 2018 Excellent Thesis Award from ICT, CAS
Outstanding Student, the SKL of Computer Architecture, ICT, CAS
- 2014 Excellent Thesis Award from the Astronomy Department of BNU
A member of LiYun experimental class of BNU

Open-Source Projects

- Qilin** A new framework for supporting fine-grained context-sensitivity in Java Pointer Analysis

QILIN enables different variables/objects in a method to be analysed under different context abstractions at the variable level, by supporting naturally the traditional method-level context-sensitivity as a special case. QILIN's toolbox includes already a rich set of state-of-the-art pointer analysis algorithms for supporting (1) Andersen's context-insensitive analysis, (2) all common flavors of method-level context-sensitivity (e.g., k CFA and k OBJ), and (3) many flavors of fine-grained context-sensitivity, enabled by different pre-analyses such as EAGLE, and SELECTX. QILIN outperforms the state-of-the-art in both precision and efficiency.

Project: <https://github.com/QilinPTA/Qilin.git>

Docker image: <https://hub.docker.com/r/hdjay2013/qilin>

Conch A context debloating tool for accelerating all the object-sensitive pointer analysis

CONCH identifies context-independent objects by verifying three linearly verifiable conditions (which are almost always necessary for objects in the real-world applications to be context-sensitive) and then eliminates redundant contexts composed of these objects (which are usually not precision-beneficial). CONCH can speed up object-sensitive pointer analysis substantially and analyze more programs scalably at only a negligible loss of precision.

Project: <http://www.cse.unsw.edu.au/~corg/tools/conch/>

Docker image: <https://hub.docker.com/r/hdjay2013/conch-tosem-artifact>

Turner A sweet spot between accuracy and efficiency in existing pre-analyses for accelerating object-sensitive pointer analysis

TURNER is designed to enable object-sensitive pointer analysis to run significantly faster than the precision-preserving approach and achieve significantly better precision than the currently best non-precision-preserving approach. TURNER is the first intra-procedural pre-analysis in selecting precision-critical variables and objects.

Project: <http://www.cse.unsw.edu.au/~corg/turner/>

Docker image: <https://hub.docker.com/r/hdjay2013/turner>

IctApiFinder A systematic approach for automatically detecting incompatible API usages in Android Apps

ICTAPIFINDER is designed to reduce the incompatible API usage detection problem into an inter-procedural context-sensitive data-flow analysis problem for the first time. The tool dramatically improves the precision of Android Lint, reducing its false positive rate by 82.1%.

Project: <https://github.com/DongjieHe/IctApiFinder.git>

Docker image: <https://hub.docker.com/r/hdjay2013/ictapifinder>
